

— EDITION 05

The \$2,000 Calendar Leak

Giving an AI access to your calendar is trivial. Giving it access to your corporate treasury is a compliance nightmare.

A 6-part breakdown

SWIPE >>>>

0101 / 06

The Fear of the Rogue Prompt.

If a malicious actor can trick your autonomous productivity agent via prompt injection, they can theoretically instruct it to drain connected financial accounts.

0202 / 06

Why Traditional Bank Access Controls Fail AI.

Standard corporate bank accounts grant broad, absolute access once authenticated. They do not understand how to grant nuanced, programmatic permissions to a piece of code.

0303 / 06

Enter Programmatic Mandates & Budgets.

The fix requires hard coding immutable guardrails outside the LLM: 'This agent may only spend up to \$50 per transaction, maximum \$500/week, exclusively at approved cloud vendors.'

0404 / 06

The Role of Cryptographic Session Keys.

Using technology derived from modern cryptography, we can issue short-lived session keys that grant an AI agent tightly bound transactional authority that self-destructs if hijacked.

0505 / 06

The New Security Frontier.

Financial Prompt Injection Defense is becoming a multi-billion dollar market. Security teams must audit the firewalls separating cognitive models from money movement ledgers.

0606 / 06

The Future of Corporate AI Spend Policy.

Chief Information Security Officers (CISOs) and CFOs will collaborate to co-author code-enforced financial policies, replacing traditional static employee expense handbooks.

— THE TAKEAWAY
