

— EDITION 07

The Invisible Deposit Drain

*The ultimate threat to commercial banks
isn't crypto. It's autonomous money
moving out of checking accounts silently at
3:00 AM.*

A 6-part breakdown

SWIPE >>>>

0101 / 06

The Velocity of Autonomous Capital.

Traditional retail and commercial banking models rely on human inertia. Billions of dollars sit in low-yield checking accounts simply because humans are too busy to move it.

0202 / 06

Why Human Inertia Kept Banks Alive.

This cheap, 'sticky' deposit base allows traditional banks to lend profitably. But what happens when capital allocation is completely handed over to algorithms?

0303 / 06

The Automated Yield Arbitrage Engine.

An AI corporate treasury agent monitors every bank account globally in real-time. The second a yielding opportunity appears, it sweeps capital across institutions automatically to maximize basis points.

0404 / 06

Deposit Flight at the Speed of Light.

Under an agentic banking model, billions in capital can exit a bank's balance sheet in fractions of a second based on programmatic triggers, creating structural liquidity management challenges.

0505 / 06

| How Banks Must Evolve.

To retain deposits, financial institutions must abandon opaque, static interest rate tiers and offer real-time, algorithmically dynamic pricing models directly through APIs.

0606 / 06

The Rise of Programmable Core Banking.

The core ledger of a modern bank must transform from a batch-processed relational database into a real-time, event-driven architecture capable of interacting with autonomous software actors.

— THE TAKEAWAY
