

— EDITION 42

The card renderer that shrinks text until it actually fits

Every post my content agent writes ends up on a fixed-size card, and my first version used one font size for everything.

A 7-part breakdown

SWIPE >>>>

0101 / 07

| The card is a fixed size.

Same canvas, same fonts, same margins,
whatever the agent writes that day. Nothing
about the layout adjusts itself automatically.

0202 / 07

| One font size for everything.

The first version of the renderer drew every hook and body at the same size, regardless of how much text it had to hold.

0303 / 07

| A five-word hook was
fine.

Short copy never exposed the problem. It sat comfortably inside the card with room to spare.

0404 / 07

| A longer hook ran off the
card.

Two lines of body text pushed straight past the bottom edge, mid-word, with nothing catching it before render.

0505 / 07

| The fix was not a bigger table.

Adding more font-size tiers would only have delayed the same failure at a new length.

0606 / 07

Measure first, draw second.

A small function checks the hook and body against the canvas, steps the font size down until both fit, then hands off to the part that draws.

0707 / 07

No copy gets truncated now.

Whatever length the agent writes on a given day, the card fits it before a single pixel is drawn.

— THE TAKEAWAY

Small fix, whole bug class **gone.**

What is the smallest fix in your stack that quietly removed a whole category of bugs? Follow Joseph Bankole for more builds in public.
