

FIELD NOTES

The Zero-Budget Build.

A football site that ranks, with no monthly hosting bill.

Swipe >>>

THE BRIEF

One sentence

A free football-history site that can actually rank, and no hosting cost. Underspecified, with a hard constraint baked in.

THE DECISION

The constraint architected it

No budget for servers meant no database and no backend. So the whole thing is static. The limit chose the design.

THE PIPELINE

Write, build, ship

Write a piece in Markdown. A build step renders finished HTML with the schema search engines read, regenerates the sitemap, ships to free hosting on every commit.

THE REAL WORK

It was the wiring

Not the writing. Machine-readable schema for rich results, auto-linked pages that build their own authority, dependency-light so it does not rot.

THE RESULT

Zero, in days

Infrastructure cost: zero. Time from 'can you' to first pages live: days, not weeks.

THE TAKEAWAY

The limit was the design.

When a hard constraint got forced on
your build, did it wreck it or make it
better?
