

— EDITION 08

The SaaS Nightmare: Autonomous Churn

Your AI agent could save you \$2,000 a year on SaaS and utilities without ever asking for your permission.

A 6-part breakdown

SWIPE >>>>

0101 / 06

The SaaS Nightmare: Autonomous Churn.

Many consumer and B2B software companies survive entirely on 'vampire metrics'—users who forget to cancel monthly subscriptions they no longer actively use.

0202 / 06

How Agents Audit Usage in Real-Time.

An AI financial assistant continuously monitors app usage logs against your connected billing accounts. If a software tool sits idle for 14 days, the agent cancels it instantly.

0303 / 06

The Death of the 'Forgot to Cancel' Model.

SaaS businesses built on clunky cancellation dark-patterns will crumble. AI agents do not get confused by hidden cancellation buttons; they execute programmatic termination commands.

0404 / 06

Shift From Monthly SaaS to Pay-Per-Execution.

As agents dominate buying decisions, software pricing will aggressively transition from static monthly recurring revenue (MRR) to ultra-granular, usage-based execution models.

0505 / 06

Designing a Product That an AI Won't Cancel.

To survive in an agentic economy, your software tool must demonstrate clear, continuous, machine-quantifiable ROI that an AI auditor can verify on every single ledger cycle.

0606 / 06

Save This: Build Software an Agent Won't Cancel.

1) Show machine-quantifiable ROI on every billing cycle. 2) Kill dark-pattern cancellation — agents aren't confused by it. 3) Move from flat MRR to usage-based execution pricing. 4) Log delivered value, not vanity metrics. 5) Assume the *14-day idle audit* is coming.

— THE TAKEAWAY

Would yours **survive?**

Comment what your product would look like in an autonomous usage audit. Repost to share it, and follow for daily agentic payments breakdowns.
